Exercise 1: Depth vs. expressivity of ReLU networks

We want to show that any MLP $\mathbb{R}^d \to \mathbb{R}$ with ReLU activation function represents a piece-wise linear continuous function, and that any piece-wise linear function $\mathbb{R}^d \to \mathbb{R}$ with n pieces can be represented by an MLP with depth at most $\lceil \log(n+1) \rceil + 1$.

Q1: Construct a 2-layered NN f such that $f(x, y) = \max(x, y)$.

Q2: For $f_1, ..., f_N$ functions that can each be represented by k_i-layered neural networks, show that $f = \max(f_1, \ldots, f_N)$ can be represented as a neural network with depth at most $\max(k_1, ..., k_N) + \log_2(N) + 1$.

Q3: Conclude that any continuous piece-wise linear function f on $\mathbb{R}$ with n pieces can be expressed as a MLP with depth at most $\lceil \log_2(n+1) \rceil + 1$. *Hint: there exist* $s_1, \ldots, s_K \in \mathbb{R}$ *and* $(f_{i,k})_{1 \le i \le n, 1 \le k \le K}$ *linear functions such that* $f = \sum_{k=1}^{K} \max(f_{1,k}, \ldots, f_{n,K})$.

Exercise 2: Approximation of real functions

Let $\sigma(x) = \max(0, x)$ for any $x \in \mathbb{R}$. We want to prove that any continuous function $f : \mathbb{R} \to \mathbb{R}$ can be approximated on any compact set, at any given precision, by a 2-layered neural net (1 hidden layer) with activation function σ.

Q4: Approximate with a precision $\varepsilon > 0$ the function $f(x) = x^2/2$ on $[0, 1]$.

Q5: Approximate with a precision $\varepsilon > 0$ the function $f(x) = x^n/2$ on $[0, 1]$ for any $n \in \mathbb{N}$.

Q6: Approximate any continuous function on $[0, 1]$ by an MLP.

Q7: If $f : [0, 1] \to \mathbb{R}$ is L-Lisphitz, how many neurons are required for a given precision $\varepsilon > 0$?
